Interest Coverage	3.29x	3.60x	4.25x	5.25x	6.78x

6. Key Assumptions

- Revenue CAGR of ~20% FY25-29 driven by order book execution and new awards

- EBITDA margin stabilization at 25% from scale benefits and higher HAM share
- Debt reduction from FY2027 as HAM annuity cash flows begin and older TLs amortize
- New order win rate: INR 12,000-18,000 Cr p.a. based on NHAI tender pipeline
- No equity dilution assumed; growth funded through internal accruals + debt
- Bitumen price assumption: INR 40,000/MT (stable) based on OPEC+ production outlook
- Steel price assumption: INR 55,000/MT (stable) with import substitution benefits
- NHAI payment cycle: 45-60 days for EPC milestones (no material delays assumed)

7. Risk Factors

- Government capex slowdown or election-year spending deferral
- Raw material cost spike (bitumen linked to crude oil)
- Land acquisition delays on HAM projects
- Labour availability challenges at remote project sites
- Working capital stretch if NHAI payment cycle extends beyond 90 days
- Interest rate changes impacting debt servicing cost
